- MotoG3 2015 (Osprey)
- Android Lollipop 5.1.1

Snapdragon 410
- Quad-core, 1.4 GHz
- 8 GB storage,
1 GB RAM

Android

- Operating system for mobile devices (touch screens)
- Developed by Android Inc.
- Purchased by Google (2005)
- Based on the Linux kernel
- Recent Android versions:
Marshmallow, Nougat, Oreo,
Pie, 10, 11

Android

- Android Open Source Project (AOSP)
- Designed for small screens, limited storage and battery life
- Comprehensive system, easily modified
- Android Software Development Kit (SDK)
- Multiple versions – “vanilla” Android, but can also have add-ons, remix, etc.

Biggest Downsides

- Over-the-air (OTA) updates are only available for a limited time
- OEM's are slow to upgrade
- End-of-life schedule is not well understood
(When will your phone's Android OS no longer be supported?)
- Often, there is no path to a new release of the Android OS
(So, what then? – There is a solution!)

Google's EOL Policies

Nexus/Pixel devices:

Version updates for at least two years
(three years for Pixel)

Security patches for three years

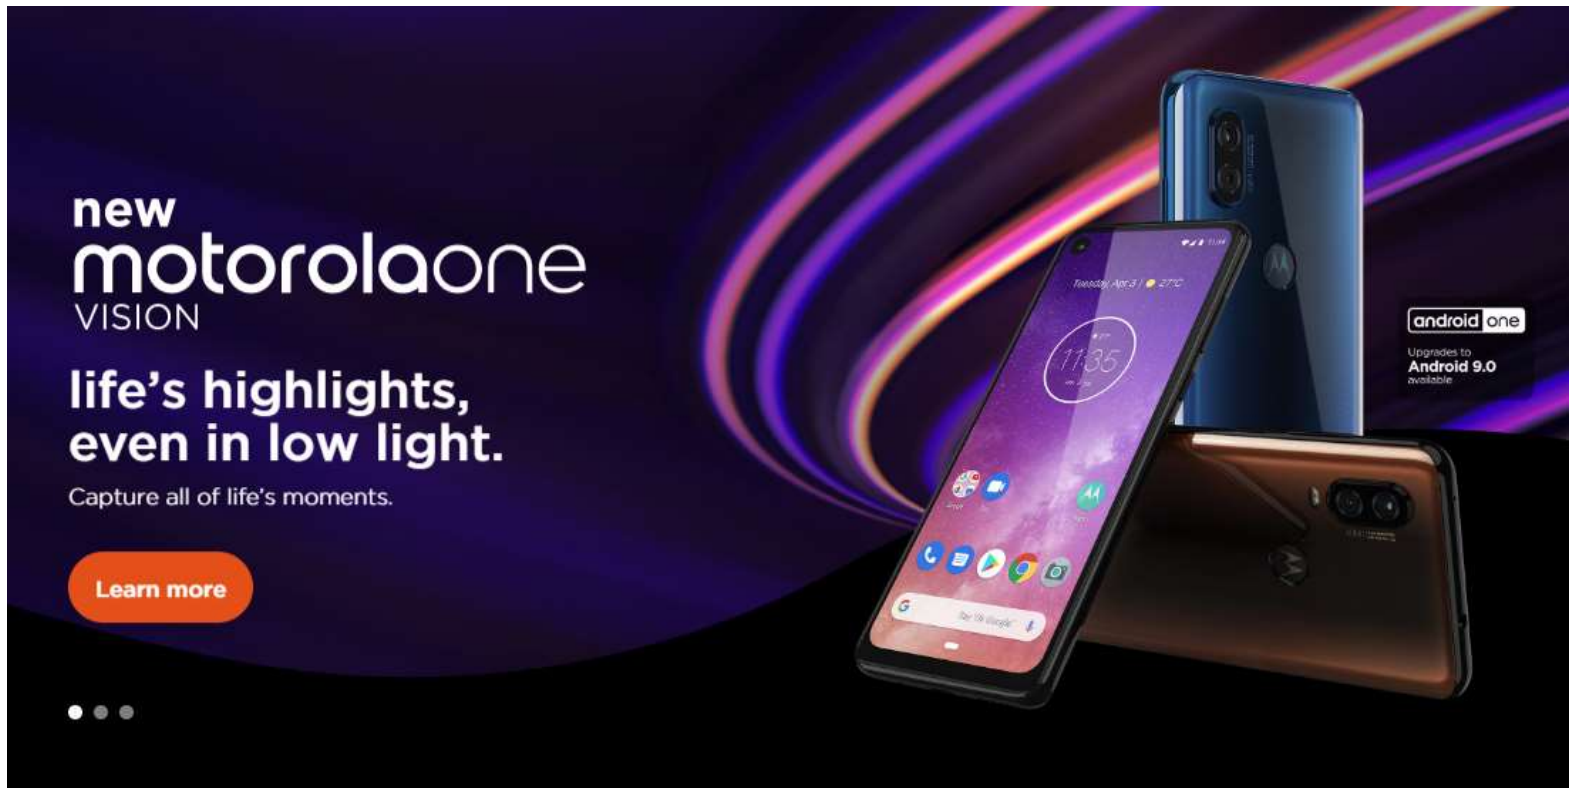

(or 18 months after a device is no longer being sold)

The rest of us:

Updates are managed by the manufacturer

System updates may take two weeks

Version updates may be discontinued
after 18 months

Android Annoyances

Android apps don't always work
“as advertised” – and certainly not
always as desired!

Where are apps stored?

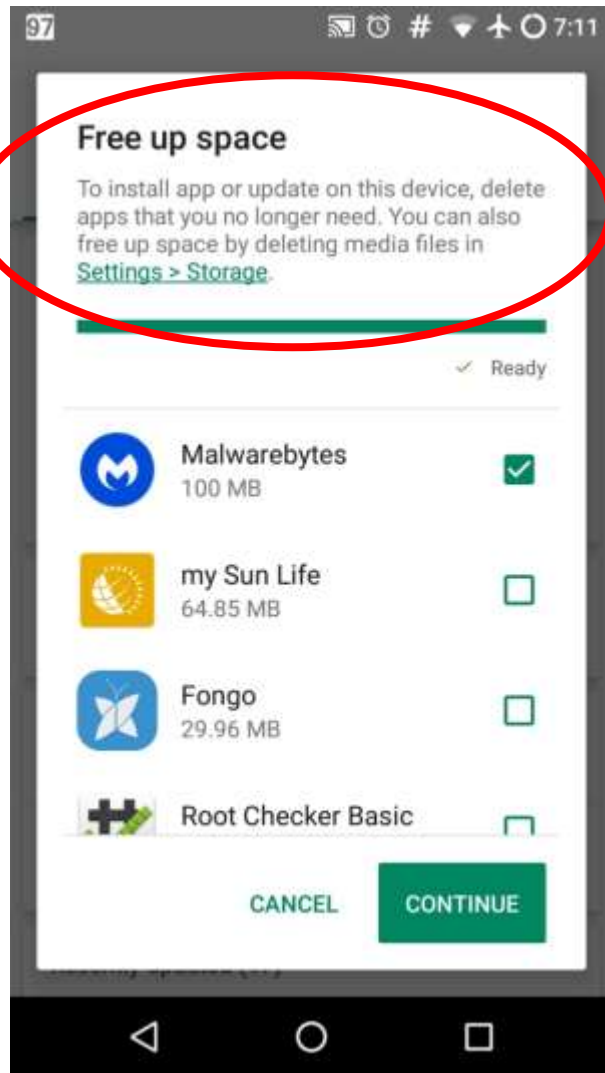

- Many apps are stored in the phone's main memory
- But, this can be a problem when internal storage is limited
- For example, my MotoG3 has 8 GB, but, the OS, the pre-installed apps, and just a few user-installed apps leave about 500 MB free!

Annoyances – “Free” space

- Play Store
My apps & games
Updates pending
- **494 MB available**
in main storage
- Pending update
is **77 MB** - but
much smaller
updates also cause...

Annoyances – “Free” space

- Nice of Android to suggest that I remove the virus scanner!
- Why do I need to remove anything?

Custom ROM's

- Android is open-source
- Third-party developers create custom ROM's (i.e. different versions of the OS and the apps)
- Bootloader must be unlocked (phone not tied to a specific carrier)
- Custom ROM is flashed to phone
- Phone can be rooted (if desired)

The Ultimate Solution?

How to build your own custom Android ROM

<https://www.youtube.com/watch?v=99LUjX63LhU>

Hardware requirements

Your development workstation should meet or exceed these hardware requirements:

- A 64-bit environment is required for Android 2.3.x (Gingerbread) and higher versions, including the master branch. You can compile older versions on 32-bit systems.
- At least 250GB of free disk space to check out the code and an extra 150 GB to build it. If you conduct multiple builds, you need additional space.

Software requirements

OS

If you're developing against the AOSP `master` branch, use either Ubuntu 14.04 (Trusty) or the latest versions of macOS and Xcode with command line tools installed.
